### Treatments Result in Efficient Fat Elimination

When applied in proper frequency and intensity to excessive layers of subcutaneous fat, low frequency ultrasound waves can cause cavitation vacuums or "bubbles" to implode against fat tissue, applying steady pressure until fat cell membranes rupture.

### One Month After (Four (4) Treatments)

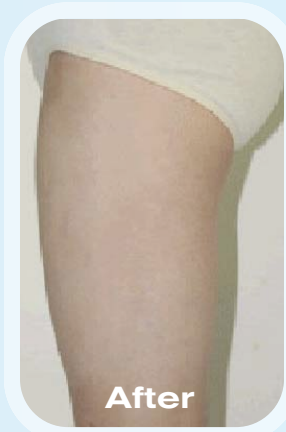

All Photos Courtesy of Dr Thomas Barrows M.D. (Minneapolis, MN)

This rupture allows the liquid fat (mainly triglycerides) inside the fat cells to be emptied into the area between the fat cells called the "interstitial space". The fat cell contents and the remaining debris is then more easily transported via normal channels and eliminated via the circulatory and lymphatic systems.

### Skin Tightening

### Body Shaping

### Shrinkage of Fat Cells
